Product description

Bectron® PU 4515 is a two-component liquid polyurethane system modified with polybutadiene providing high flexibility and rubber-like properties down to low temperature.

Curing is carried out with the Hardener Bectron® PH 4912.

The system meets the requirements of ROHS.

Areas of application

Bectron® PU 4515 has excellent flexibility down to low temperatures and is suitable for use in devices operating in a wide temperature range -60 to +150°C. It is suitable for potting sensitive components and PCBs for outdoor applications. The high chemical resistance will give protection from humid, alkaline and acidic environments.

Properties

A resilient elastic casting compound for mechanically sensitive electronic components and PCBs

Potting Compound with rubber like properties

High temperature resistance to 150°C

Flexible down to -60°C

Low shrinkage

Good dielectric properties

Good Adhesion

ROHS Compliant

Storage

Containers filled with Bectron[®] PU 4515 should be kept closed to protect the resin against humidity. During longer storage periods of the containers, some settling of the pigments can occur and it is advisable to homogenise the resin by stirring of the containers prior to filling storage or service tanks.

Opened containers of the Hardener Bectron® PH 4912 should be used up as soon as possible because moisture in air reduces reactivity.

The Hardener Bectron® PH 4912 might form crystals at temperatures below 0 °C. Heating the entire contents of the drum for a short time to 70 °C will recover the complete liquid state.

Processing

Pretreatment: The components to be potted should be clean dry and free from grease. Compatibility between the resin and all materials on a PCB should be checked prior to use.

Preparation: Bectron® PU 4515 polyurethane component contains filler materials which tend to settle, depending on storage temperatures. Very thorough stirring is necessary prior to the mixing process.

Mixing: Bectron[®] PU 4515 and the Hardener Bectron[®] PH 4912 require the specified mixing ratio. After intensive mixing, the compound is ready for use immediately. During the mixing process make sure stirring introduces as little air as possible.

Application: The processing time is about 14 minutes. Within this time, viscosity will increase; therefore, the prepared volume should be just enough to permit processing in this time. The compound is best processed by casting using two-component metering equipment but manual casting is possible.

Curing: Recommended curing conditions are:

- At RT 6-8 hours
- 40-60°C 1-2 hours

Transition to solid at room temperature takes 40 minutes.

Curing does not require pressure assistance PU compounds cured at Room temperature should not be subjected to mechanical or electrical loads for 3-4 days to allow full development of cured properties.
